

Neuroanatomical foundations of cognition

Lecturer: Stefano F. Cappa

H: 10

Credits: 2

Semester: I

Compulsory course: A

Description

A basic level knowledge of the anatomical structure of the cerebral cortex is a pre-requisite for the ambitious goal to gain some understanding of its complex functions. In this introductory course we will review the main aspects of cortical organization, including phylogenetic and ontogenetic aspects, the macroscopic subdivisions, the microscopic structure of different cortical types, the main models of their functional organization. These basic aspects will be integrated with a discussion of the leading methodological advances in the field of in vivo brain imaging and of their impact on cognitive neuroscience research

Suggested readings

Mesulam, M.M., 2000. Principles of behavioral and cognitive neurology. Oxford University Press. (section 1, Behavioral Neuroanatomy)

Evaluation

The evaluation will be based on a student presentation

Calendar

February 25th, 2019 - 9-13

February 27th, 2019 - 9-11

March 1st, 2019 - 9-13 annullata

March 4th 2019 – 9-13 recupero

Classroom 1-15
